~~H-infinity methods in control theory - Wikipedia~~

Robust-and-Adaptive-Control For a class in Robust & Adaptive Control, I created Matlab implementations of LQR, RSLQR, H-infinity, and LQGLTR state-feedback controllers. Further built into these implementations are extensive time-domain and frequency domain analyses, along with useful frameworks for using these analyses to determine optimal gains.

H_∞ (i.e. "H-infinity") methods are used in control theory to synthesize controllers to achieve stabilization with guaranteed performance. To use H_∞ methods, a control designer expresses the control problem as a mathematical optimization problem and then finds the controller that solves

The adaptive H_∞ filter is more robust because of the robust estimation method, based on the control of dynamic model errors and uncertain interference. In all presented cases, RMSEs of the AHF algorithm are the smallest for all coordinates, which means that the positions calculated by the AHF algorithm are in good agreement with the actual positions.

In this paper, an adaptive robust H_∞ control scheme is proposed to achieve both the load tracking and multi-motor synchronization of MMS. This control scheme consists of two parts: a robust tracking controller and a distributed synchronization controller.

This study introduces a proposed control method for microgrids (MGs) in islanded (off-grid) mode. The proposed control method is developed by modifying the droop control method using H-infinity controller. In this control method, the droop control loop, current and voltage control loops are adjusted to respond to system load variation. The proposed method is an adaptive control one as it ...
