Petri Nets Fundamental Models Verification

A Petri net is a mathematical representation of a network. This book first introduces the basic models including time and stochastic extensions, in particular place-transition and high level Petri nets.

Petri net - Wikipedia

This paper proposes a Petri net model which permits the modelling and verification of interorganizational workflows. The model allows the explicit representation of the organizational dimension of each component workflow, the shared use of resources among different organizations as well as the specification of security constraints.

Monday June 24 Coloured Petri Nets II Verification and Applications (Lars Kristensen) Explicit state space exploration is one of the main approaches to computer-aided verification of concurrent systems, and it is one of the main analysis methods for Coloured Petri Nets (CPNs).

Petri Nets: Fundamental Models, Verification and Applications

A Petri net is a mathematical representation of a network. This book first introduces the basic models including time and stochastic extensions, in particular place-transition and high level Petri nets. Their modeling and design capabilities are illustrated by a set of representations of interest in operating and communication systems.

The related verification problems are then addressed and corresponding solutions proposed by introducing the main notions needed to fully understand the behavior and properties behind Petri nets. Particular attention is devoted to how systems can be fully represented and analyzed in terms of their behavioral, time and stochastic aspects by using the same formal approach and semantical basis.

Verification of Human Decision Models in Military ...

This paper aims to deal with verification of the device behaviors which are against patient's safety requirements using fuzzy rules and fuzzy Petri-net (FPN). Using the FPN, we propose a visual and a mathematical model through which one can formally verify the device behaviors against user's requirements.

Petri Nets Fundamental Models Verification And Applications

A Petri net, also known as a place/transition (PT) net, is one of several mathematical modeling languages for the description of distributed systems.It is a class of discrete event dynamic system.A Petri net is a directed bipartite graph, in which the nodes represent transitions (i.e. events that may occur, represented by bars) and places (i.e. conditions, represented by circles).

A set of formal verification criteria for human decision models are developed, based on which verification is grouped into two classes: weak verification and strong verification. By searching the fuzzy Petri nets, weak verification is implemented, and by reasoning the fuzzy Petri nets, strong verification is implemented

The Petri Net model has been around for many years and has been used extensively in simluation and verification of network protocols, a subject that is very like workflows in many ways. Therefore, it comes as no surprise that the concepts used in workflows maps onto Petri Nets in a very straight-forward way.
