The number of
Wattmeter required to

measure power in a polyphase system is determined using Blondell's theorem. According to this, the number of Wattmeter required is equal to one less than the number of wires in the circuit. For example, in a three phase, four wire system (Star network), the number of Wattmeter required is three.

Triacs are electronic components that are widely used in AC power control applications. They are able to switch high voltages and high levels of current, and

over both parts of an AC waveform. This makes triac circuits ideal for use in a variety of applications where power switching is needed.

Generation means the conversion of a form of energy into electrical energy.

In the power systems analysis field of electrical engineering, a per-unit system is the expression of system quantities as fractions of a defined base unit quantity. Calculations are simplified because quantities expressed as per-unit do not change when they are referred from one side of a transformer to the other.
