There are surprisingly few good and more importantly recent, up-to-date textbooks available on the subject of Oscillations and Waves. Richard Fitzpatrick's Oscillations and Waves: An Introduction is an excellent addition to the existing literature on the subject. The book provides a clear, systematic, comprehensive and yet concise treatment of ...

Notes on Oscillations and Mechanical Waves The topics for the second part of our physics class this quarter will be oscillations and waves. We will start with periodic motion for the first two lectures, with our specific examples being the motion of a mass attached to the end of a spring, and the pendulum.

Moving waves have momentum when a wave is absorbed or reflected by an object, the wave pushes on that object. Velocity: It takes time for a wave to go from one place to another. Light: 186,000 Miles /Sec, 300,000 KM /Sec Sound: (Through air) ~ 1129 feet /Sec Oscillations: Motions that repeat themselves.

A wave can be longitudinal where the oscillations are parallel (or antiparallel) to the propagation direction, or transverse where the oscillations are perpendicular to the propagation direction. These oscillations are characterized by a periodically time-varying displacement in the parallel or perpendicular direction, and so the instantaneous velocity and acceleration are also periodic and ...

Waves are responsible for basically every form of communication we use. Whether you're talking out loud, texting on your phone, or waving to someone in a crowd there's going to be a wave transmitting information. Learn about the basics of waves in this topic, then learn more about light waves in the topics below.
